EXP 7

Data Visualization Using Power BI

AIM:

To analyze pizza sales data using Power BI by importing and cleaning the dataset, creating key performance indicators, and building visualizations to identify sales trends, product performance and ordering patterns.

ALGORITHM:

1. Open Power BI Desktop and identify the Report, Data and Model views, along with the Visualizations, Data and Filters panes.
2. Select Home ? Get data ? Text/CSV and load the pizza sales dataset.
3. Choose Transform data and inspect the dataset in Power Query Editor.
4. Clean the data by checking missing values and duplicates, and verify data types for order date, quantity, unit price, total price, pizza category, size and name.
5. Select Close & Apply to load the cleaned pizza sales data into Power BI.
6. Create KPI cards for Total Revenue, Average Order Value, Total Pizzas Sold, Total Orders and Average Pizzas per Order.
7. Create a column chart showing total orders by day of the week and a line chart showing the monthly trend in total orders.
8. Create doughnut charts showing the percentage of sales by pizza category and pizza size.
9. Create a horizontal bar chart showing total pizzas sold by pizza category.
10. Add date and pizza category slicers to allow users to filter the dashboard.
11. Arrange the KPI cards and charts on one report page, format titles, labels and colours consistently, and save the report as a .pbix file.

OUTPUT

RESULT:

Thus, the pizza sales dataset was imported and prepared in Power BI. KPI cards, daily and monthly order trends, pizza category and size sales charts, and category slicers were used to create a sales analytics dashboard.
