EXP 8

Data Visualization Using Tableau

AIM:

To learn the Tableau Desktop workflow by connecting to employee attrition data, cleaning and preparing the data, creating visualizations such as bar charts, a donut chart and KPI cards, and arranging them into an interactive employee attrition dashboard.

ALGORITHM:

1. Open Tableau Desktop and identify the Data pane, worksheet area, Show Me panel and Dashboard workspace.
2. Connect to the pizza sales CSV file and verify that the data has loaded correctly.
3. Review the dataset for missing values, duplicate records and incorrect data types.
4. Convert order date and order time to appropriate date/time fields, and verify quantity, unit price and total price.
5. Create KPI cards displaying Total Revenue, Average Order Value, Total Pizzas Sold, Total Orders and Average Pizzas per Order.
6. Create a stacked bar chart showing the hourly trend for total pizzas sold, split by pizza category.
7. Create a line chart showing the weekly trend for total orders and identify weeks with unusually high or low order counts.
8. Create a donut chart showing the percentage of sales by pizza category and include the total sales value.
9. Create a chart showing the percentage of sales by pizza size, comparing Large, Medium, Regular, X-Large and XX-Large.
10. Create a combined bar chart comparing total orders and total pizzas sold across pizza categories.
11. Arrange the KPI cards and charts into a dashboard, apply consistent formatting, add relevant filters and save the Tableau workbook.

OUTPUT:

RESULT:

Thus, the Tableau dashboard was created for pizza sales analysis, presenting key performance indicators and visualizations for hourly and weekly trends, sales by pizza category and size, and total orders and pizzas sold across categories.
